## Scaling and Simplifying How Ohio State Used Jamf Pro to Streamline Device Management

Title slide

## Who we are

Marty Winders

Associate Director, Client Services and Engineering

The Ohio State University - Office of Technology and Digital Innovation

I am the service owner of the shared Jamf service at OSU

Ray DeMay

Senior Endpoint Engineer

The Ohio State University - Office of Technology and Digital Innovation

I am the Jamf platform administrator

## History

- 2018 - Digital Flagship led to Shared Jamf
- Device Enrollment Program and Apple School Manager not in use due to Apple's Terms and Conditions (OSU Legal)
- 15 different Jamf servers
- ~6,000 Macs
- ~12,000 Mobile Devices
- Some units not managing their Apple devices at all

© copyright 2024 Jamf

The leadership at Ohio State had a vision to provide an iPad to every incoming student and wanted to see this to fruition through the CIO, the CIO came to Marty to ask if we had the tools capable for supporting this initiative. The central IT organization was not using Jamf at the time but with an undertaking of this caliber it was identified that we must adopt the Jamf platform. While adopting the Jamf platform a vision was given to offer a consolidation of Jamf Servers as well as to offer Jamf to those areas that could not afford it our did not have the acumen to support it themselves.

Shared Jamf was then implemented as a service to help consolidate the disparate Apple device management across OSU. Our users supported by the OCIO team was migrated from Ivanti to Jamf while 15 other departments decided to collaborate into the Shared Jamf offering and decommissioning their own server. This included departments such as College of Engineering, Arts and Sciences and our Athletic Department.

While the digital flagship initiative did not last after COVID, the Shared Jamf environment continues to grow and be an effective solution across campus.

## Shared Jamf Service Overview

- One site for each college/business unit
  - Some exceptions to this
- Three tiers of access
  - Site administrator - also has permission to upload packages and scripts
  - Limited - a custom permission set for desktop support/helpdesk
  - Auditor
- API account(s)
- Self-service access management

© copyright 2024 Jamf

The basics of the shared Jamf are as follows:

Each customer gets one site, with some rare exceptions (marching band site, we have 4 sites)

There are three tiers of access. Site admins get full access to their site, plus package, script, and printer uploads at the top level. Limited is basically create/read/update only. Auditor is read-only (a built-in permissions set).

Admins could request a read-only or read/write API account (some had both)

As an approver of an App Group, you are able to use this form to add accounts that are allowed access to an App Group

Self-service access management

JNUC  
2024

This is one of the self-service request catalog forms that was built in ServiceNow to handle adding and removing users from the AD groups that Jamf access is derived from.

InCommon Grouper plays middleman, taking the AD groups and tying them to the SSO groups that are passed through Shibboleth authentication. That then grants the user their access in Jamf.

# Apple School Manager

To support the autonomy of the sites,  
admins also have ASM access

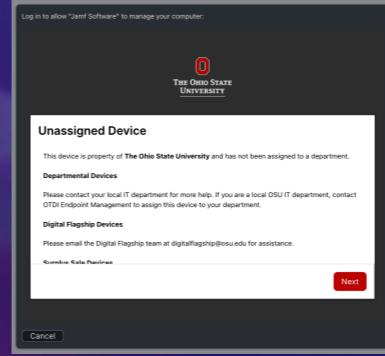

Each site has:

- an MDM token for ADE
- A location associated with a VPP token
- An admin with content manager and device enrollment manager roles
- Default Site/MDM Server
- Enrollment customization in Jamf

© copyright 2024 Jamf

The screenshot shows the Apple School Manager web interface. At the top left is the 'Apple School' logo. To its right is a search bar with the placeholder 'Search'. Below the search bar are two navigation links: 'Activity' and 'Locations'. To the right of these links is a summary box stating 'All Devices 93,990 Devices at The Ohio State University'. At the bottom right of the main area is a small 'Sort ↑' button.

JNUC  
2024

Along with Jamf, there is a shared model for ASM, albeit not as siloed (ASM limitation). We also have accounts for the site admins and some other technicians in ASM. Each site has an ADE and VPP token.

We assign a default server in ASM, which points to an “unassigned” site in Jamf. This site has an enrollment customization that is limited to one LDAP group that nobody is in. That way the device can’t finish enrolling. The messaging tells the person trying to enroll the device of their next steps.

## Service Licensing and Cost Model

OTDI owns and maintains the Jamf service. We meet with our CSM, open support tickets, schedule upgrades.

Costs are shared between departments, based on number of devices in each site. We collect counts near renewal time, asking for customers to account for any expected growth.

© copyright 2024 Jamf

Cost savings by going to Jamf Cloud and no egress costs. Cost shared between the departments by counts and that our organization maintains that information, purchases all licenses, maintains relationships and costs shares with the other units. By consolidating we also maximized our spend and our price breaks with Jamf.

Platform is owned and maintained by OTDI (you) along with our site and all of the top level configurations in partnership with College of Arts and Sciences

```
for id, site_name in site_ids.items():
    site_computer_count = site_mobile_device_count = site_apple_tv_count = 0
    for i in range(0, 3):
        site_computer_object_api_endpoint = f"{jamf_server}/api/v1/sites/{id}/objects?page={i}&page-size=2000&sort=objectType%3Aasc&filter=objectType%3D%22Computer%22"
        site_computer_objects = requests.get(
            site_computer_object_api_endpoint, headers=headers
        )
        site_mobile_device_object_api_endpoint = f"{jamf_server}/api/v1/sites/{id}/objects?page={i}&page-size=2000&sort=objectType%3Aasc&filter=objectType%3D%22Mobile%20Device%22"
        site_mobile_device_objects = requests.get(
            site_mobile_device_object_api_endpoint, headers=headers
        )
        site_apple_tv_object_api_endpoint = f"{jamf_server}/api/v1/sites/{id}/objects?page={i}&page-size=2000&sort=objectType%3Aasc&filter=objectType%3D%22Apple%20TV%22"
        site_apple_tv_objects = requests.get(
            site_apple_tv_object_api_endpoint, headers=headers
        )
    site_computer_count += len(site_computer_objects.json())
    object_ids += [item["objectId"] for item in site_computer_objects.json()]
    site_mobile_device_count += len(site_mobile_device_objects.json())
    site_apple_tv_count += len(site_apple_tv_objects.json())
```

We collect current site counts in April with a Python script, then ask each customer to confirm the counts, encouraging them to clean up old devices before final counts are sent for renewal.

<https://github.com/raydemay/jamf-site-counts>

© copyright 2024 Jamf

I wrote a Python script to get me device counts in each site, by type (computer, mobile device, Apple TV)

## Early Challenges

Move from on-premises to cloud was **rocky**

Shared service didn't have a lot of sharing

- Every site had the same kinds of config profiles and policies
- Package and script duplication
- No mechanism to share ideas
- Performance issues

© copyright 2024 Jamf

Some of the early bumps in the road with the service. Units were using the service correctly, or at least in the way that they were sold, but it turns out that the approach was wrong from the beginning. Moving to Jamf Pro Premium Cloud helped a bit, but the actual move was a disaster.

## Top-Level Changes (Summer 2021)

To remove duplication and improve Jamf performance, many deployments were moved to the top of the instance

- Self Service applications with custom triggers
- Common configuration profiles
  - CrowdStrike
  - Microsoft
  - Cisco Secure Client
  - BeyondTrust Remote Support
  - Symantec DLP
  - Other common PPPC and system extension profiles

© copyright 2024 Jamf

To both improve performance in Jamf, and to provide more value to customers, some common policies and config profiles were moved to the Full Jamf Pro level and scoped to all devices (with exclusions)

Providing top level Self Service in Shared Jamf allows us to eliminate redundancies in duplicate package/policy creation to provide a more streamlined management experience for users and admins

Shared configuration profiles meant that the most common config profiles weren't being distributed 18 times, cutting back on the bloat in Jamf.

We still can't create a full Jamf Pro summary, even after all of this work!

## Identity Crisis

As the Apple device management platform and service owners, we were looked to by the shared Jamf customers for a good solution to account management on Macs.

OTDI was using Centrify, but was that the best option?

AD binding? 😱

NoMAD?

(Somebody ask Marty about Enterprise Connect, please)

© copyright 2024 Jamf

OSU is a mess when it comes to identity. Multiple domains, decentralized IT, different levels of administration skill and effort. As owners of the Apple device management service, we wanted to be able to prescribe a good solution for account management on Macs that worked for every use case

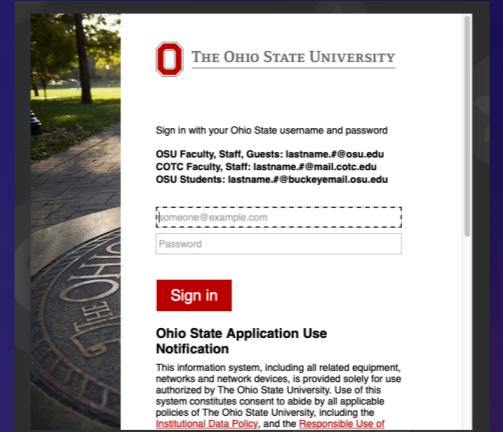

# Jamf Connect

We landed on Jamf Connect to manage identities on Macs.

- Custom ADFS webpage with JavaScript to handle the different usernames
- Previously had to have separate configurations for faculty/staff and students, making mixed use devices impossible

© copyright 2024 Jamf

**JNUC**  
2024

This is Jamf Connect as it currently stands for OSU. We are working to move to Entra ID with password hash sync. Hoping to include privilege elevation, but that might not be ready for our uses *quite* yet.

## Adding More Value (2022-Current)

I became the Jamf platform owner in January 2022

Changes since then:

- More top-level config profiles and policies
- 802.1x device authentication
  - Was only for OTDI at first
- More useful extension attributes

© copyright 2024 Jamf

More changes since I took over. The big one is eduroam and 802.1x. Our 802.1x implementation is what I am going to cover in more detail in the next few slides.

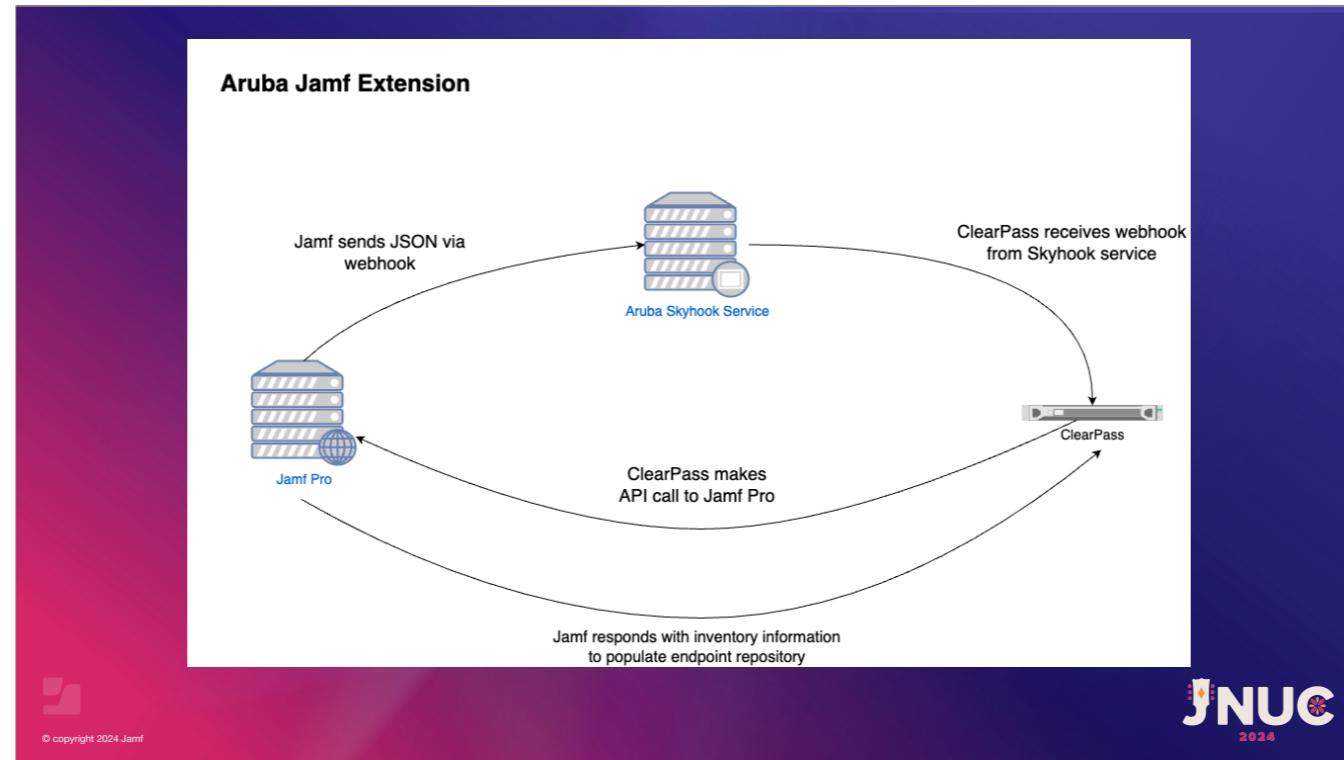

# **802.1x Device Certificate Authentication**

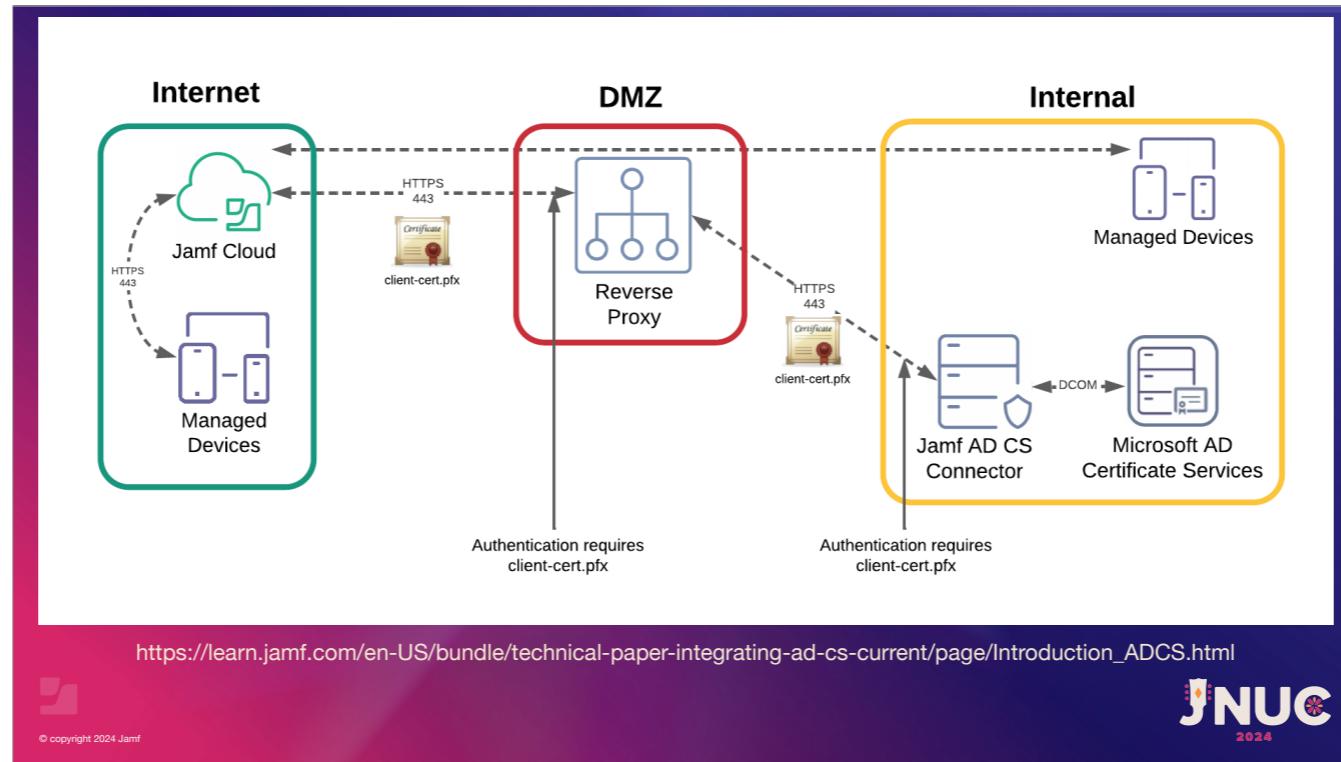

© copyright 2024 Jamf

Section slide to indicate the topic

This is my understanding of how Aruba's ClearPass Jamf extension works with web hooks triggering the API calls back to Jamf

We utilize the AD CS connector for getting the 802.1x certificates. This is the diagram that Jamf provides in their documentation.

## 802.1x Device Auth

Single configuration profile for wired and wireless

- All mobile devices also have a wireless profile

Wireless is configured for eduroam

- <https://internet2.edu/eduroam-global-roaming-access-service/>

Certificate CN is \$SERIALNUMBER@jamf.it.osu.edu

Certificate SAN is the serial number

- Don't need to care about MAC address

© copyright 2024 Jamf

One last slide to cover the config profile side of the 802.1x implementation

Mentioning eduroam since this is something other higher education institutions should look into

# API Usage in Sites

© copyright 2024 Jamf

Section slide to indicate the topic

# Extension Attributes

We rely heavily on extension attributes, and could probably have even more. While many of these are populated by EA scripts, a lot of them are text fields filled in through means outside of Jamf via the API.

**Be careful** with what you return to your EAs!

|                                       |                     |
|---------------------------------------|---------------------|
| CrashPlan Last Backup Date:           | 2024-05-19 21:49:46 |
| CrashPlan Status:                     | On, Not Logged In   |
| CrowdStrike Agent ID:                 | [REDACTED]          |
| CrowdStrike Status:                   | Running             |
| CrowdStrike Tags:                     | CI001-MITS,PREVENT  |
| Initial Configuration Complete Check: | true                |
| Java JDK:                             | Amazon              |
| Last Reboot:                          | 2024-05-16 10:42:20 |
| Nessus Agent Status:                  | Running             |
| Nessus Installation Status:           | Installed           |
| Nessus Last Successful Connection:    | 535                 |

© copyright 2024 Jamf

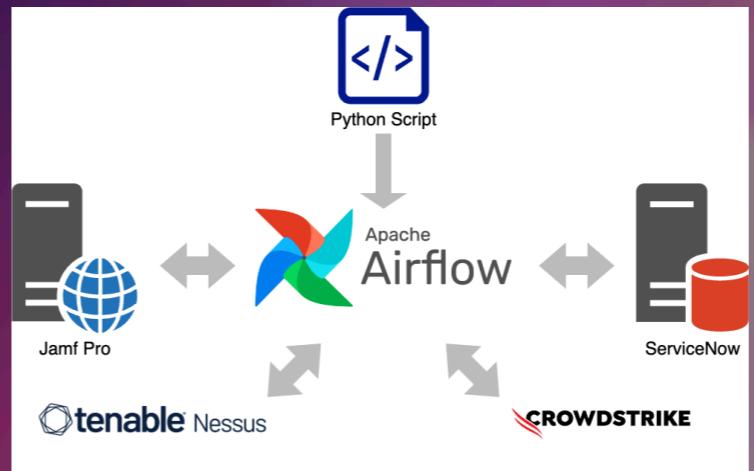

## Extension attributes

We use these. A lot. From reporting on different agents on the device, to handling local admin and network authorization roles, and CMDB information. We learned the hard way to not try to overload EAs with a lot of data, and to be picky with what is added.

# ServiceNow

We integrate ServiceNow into our device management using Python scripts that are orchestrated with Airflow

- Jamf
- CrowdStrike
- Nessus

## ServiceNow integration

Instead of using the ServiceNow app, we have a custom API workflow utilizing Apache Airflow for orchestration. Python scripts run to get or post data via Jamf or other device management APIs. This image leaves out Active Directory, but there is a lot of AD integration for the Windows side of the house

Arts and Sciences is doing similar things with TeamDynamix and a “jss-api-worker” server running Flask

## ServiceNow

In the sites that we directly manage, we use ServiceNow in Jamf for:

- Local admin requests (Privileges)
- Network authorization roles
- Software update cycles and exceptions
- Inventory info based on the CI
  - Asset tag
  - Assigned user
  - Status

© copyright 2024 Jamf

More details about what we do with the custom API workflow. This is mainly about reading/writing EAs. I will mention our plan for CrowdStrike here.

# Looking Forward

© copyright 2024 Jamf

Section slide to indicate the topic

## Future Work

Some of the things we have planned in the future:

- Top-level Jamf Connect configuration profiles
- More automation
  - Jamf App Catalog
- Documented best practices
- Package lifecycle
- More frequent auditing

© copyright 2024 Jamf

Some of the future plans we have for the service

We want to put the basic Jamf Connect settings at the top

Utilize Jamf App Catalog in self service at the top

Provide a best practices document specific to shared Jamf

## Building Best Practices

In our shared model, the site admins are basically given full reign over their site, but there are some considerations:

- Configuration profiles used by everyone go to the top to lower total number of payloads
- Packages should be named with a unit prefix only if the package is specific to the unit (license files, custom configs, etc.)
- Don't deploy bad policies (all computers, ongoing frequency)
- Extension attributes have to be approved and uploaded by service owner

© copyright 2024 Jamf

These are some of the best practices that we have come up with so far. There is a document that we are working on with Arts and Sciences that will have everything to keep in mind

## Jamf Sites Wishlist

- Sites as an indexed value in inventory records
- LAPS
- Device Compliance
- Dynamic group scope
  - Create a smart group at the top level, scoping at site level only gets devices in the site that fit the top-level criteria

© copyright 2024 Jamf

This is our wishlist from Jamf to improve using sites in Jamf Pro.

## Sharing Our Work

We have had the opportunity to share this with other universities as they look to better manage their Apple devices

- Texas A&M University
- University of Kentucky
- Kansas State University
- Big Ten Schools
  - Penn State University
  - University of Illinois
- Ohio Universities

© copyright 2024 Jamf

The schools we have had the pleasure of sharing how our shared Jamf model works
